America launched new strikes on **Iran**, but again claimed they were “purely defensive and intended to maintain the ceasefire”. US Central Command said its forces had shot down drones launched from southern **Iran**. Soon after, Kuwait said it was “confronting hostile missile and drone attacks”; Iran said it had targeted an “American airbase” but did not specify where. Oil prices jumped in response to the fighting.

Earlier **Donald Trump** said he was “not satisfied” with Iran’s proposals to end the war, and that the country was “negotiating on fumes”. Iranian state media outlets released what they claimed to be a draft **peace deal**, which included a commitment from America to move its troops away from Iran and lift its naval blockade. The White House called the report a fabrication.

Israel’s army ordered the evacuation of much of southern **Lebanon**, as it carried out air strikes on the city of Tyre. **Hizbullah** said it had engaged with Israeli troops “at point-blank range” near the town of Zawtar al-Sharqiyah. Each side accused the other of breaking their ceasefire. Meanwhile Hamas confirmed the death of Mohammed Odeh, its new military leader, in an Israeli air strike on Gaza on Tuesday.

Volodymyr Zelensky, Ukraine's president, travelled to Sweden ahead of a possible announcement on the sale of fighter jets to his country. Last year Ukraine signed a letter of intent to buy up to 150 Swedish Gripen model E fighter planes. Earlier Mr Zelensky appealed to America for more Patriot PAC-3 missiles and other air-defence systems to [counter attacks by Russia](#).

Albert Manifold, the former chairman of BP, a British oil giant, accepted the unanimous decision by the board to [oust](#) him on Tuesday, but called its allegations against him "lies". In a minimalist statement, the board had cited "serious concerns" with his behaviour during his tenure of less than eight months. Ian Tyler will take over in the interim.

South Africa's government, along with lobby groups representing [the country's](#) white Afrikaner minority, dismissed claims by the Trump administration that white South Africans are facing an "unforeseen emergency refugee situation". Mr Trump absurdly claims there is an ongoing "genocide" of Afrikaners, and has promised to admit to America those fleeing ostensible persecution by their government.

New York and **New Jersey** are investigating FIFA over allegations of [inflated](#) pricing and misleading ticketing procedures for upcoming [World Cup](#) football matches. The joint probe follows complaints by fans that they were assigned worse seats than they had paid for. Investigators will focus on the eight matches scheduled at the MetLife Stadium in New Jersey, including the final in July.

Figure of the day: 159%. The growth in operating profits at South Korea's biggest companies over the past year. This is [thanks chiefly to the country's high-tech exporters](#).

Why China is courting Serbia

Serbia's president, Aleksandar Vucic, will finish his first state visit to China on Thursday after five days of pomp. The Balkan country will have drawn more attention from Chinese officials since Viktor Orban was **voted out** as Hungary's prime minister on April 12th. The populist Mr Orban had been China's staunchest supporter in an increasingly China-sceptic European Union. Mr Vucic, whose country is applying to join the EU, is another Chinese cheerleader.

On Monday Xi Jinping, China's premier, awarded him the golden "Friendship Medal"—an honour also bestowed on Vladimir Putin, Russia's president, and Raúl Castro, Cuba's de facto leader. But Mr Vucic is discovering, as Mr Orban did, that popularity in Beijing does not necessarily boost it at home. Protesters roiled Belgrade as he set off for China. Their demands include clarity about Serbia's infrastructure-building projects, in which China is a major partner.

Tokyo's battle of the bots

Humanoid robots can dance and back-flip to amuse in viral videos. But the [big question is whether they can replace human labour](#). The Humanoids Summit, which opened on Thursday in Tokyo, will make the case that they can. For two days researchers, policymakers and companies such as Google DeepMind, an artificial-intelligence firm, and Toyota, a carmaker, will extol the virtues of humanoid robots, whether imbued with AI or merely mechanical.

Japan, where an ageing population and chronic labour shortages have made automation a national priority, is a particularly appropriate venue. It created the first humanoid robot back in the 1970s, and has long led the industry. But [China](#) has since stolen the lead. It produced 90% of humanoid robots shipped last year. Japan Airlines, the country's flagship carrier, recently announced a trial in which it will use automatons to load and unload cargo. They are all built by Chinese firms.

The NBA plays to win

Have this year's playoffs in North America's National Basketball Association been unusually gripping? Or do they just feel that way because all the players are actually trying? [Misaligned incentives](#) have made much of the league's long regular season—which determines which teams make the championship playoffs and where they are seeded—increasingly [hard to watch](#).

The NBA determines the selection order for its annual draft of incoming players through a lottery. The teams with the worst records get the best odds of receiving the first pick. Unsurprisingly, many clubs have responded by “tanking” (intentionally losing games) to improve their chances of drafting a future superstar.

That practice could finally be ended on Thursday, when the league is expected to pass an anti-tanking reform. The three teams with the most losses will get just two balls in the lottery, compared with three for clubs above them. Like teams facing relegation in European football, the NBA's stragglers might be encouraged to play harder.

Data bite: Why science is becoming less innovative

In 2023, an influential study found that science was [producing fewer breakthroughs](#) than it once had. A new paper helps explain why. Research led by the University of Pittsburgh analysed the careers of 12.5m scientists who published papers between 1960 and 2020. They found that with age most became more likely to build on, rather than challenge, existing theories. In countries with older workforces, such as America and Japan, “disruptive” papers—meaning those introducing novel ideas, assessed using subsequent citations—accounted for a smaller share of research output than in countries whose scientists skewed younger, such as China and India.

Cause a stir

Probability of a scientist producing a top 10% disruptive paper* by discipline, 1960-2020, %

Daily quiz

We will serve you a new question each weekday. On Friday your challenge is to give us all five answers and tell us the theme. Email your responses (and your home city and country) by 1700 BST on Friday to [\[email protected\]](#). We'll pick three winners at random and crown them on Saturday.

Thursday: Which philosopher and economist was born in Trier in 1818 and died in London in 1883?

Wednesday: Robert Johnson and Muddy Waters were pioneers in which music genre?

*Where hope rises fear must lurk
behind.*
